

Does the switch s optical module need debugging

Preview

When optical modules are installed on switches, it is necessary to read internal module parameters to monitor operating status, including link connectivity, real-time transmit/receive optical power, and temperature. In the switch command line, enter `bcmsh`. Take the lane number obtained from the first step and divide it by 2 (no need to divide by 2 for N9500-128QC devices). This corresponds to the "physical" number in `show portmap`, such as 157. Verifying module identification also helps check coding compatibility between the.
