

Wiring terminals of old-style distribution boxes

Preview

The photograph on the left shows a dual panel configuration: a main panel on the right (with front cover in place) and a subpanel on the left (with cover removed). The subpanel is fed by two large hot wires and a neutral wire running through the angled conduit near the top of the panels. Overview A distribution board (also known as panelboard, circuit breaker panel, breaker panel, electric panel, fuse box or DB box) is a component of an electrical system that divides an electrical power feed into subsidiary circuits. North American distribution boards are generally housed in enclosures, with the components positioned in two columns operable from the front. Some panelboards are provided with a door covering the front. This picture shows the interior of a typical distribution panel in the United Kingdom. The three incoming phase wires connect to the busbars via a main switch in the centre of the panel. On each side of the panel are two.

This shows the incoming supply, meter and various fuse boxes in a cupboard. Everything inside is connected to the supply, and there are multiple exposed live parts. The only recent items are the cutout, meter and wires between them. Everything else has been there for at least 50 years, and in some cases is well over 60 years old.
